

Supplementary Figure 3 Best matches to the intronic and intergenic^{tr} UCEs exhibit lower overall % identity as compared to matches to the exonic UCEs. Of the 896 combined UCEs, 172 are exonic, 302 are intronic and 422 are intergenic^{tr}. Length, length of the UCE. Note that % identity is calculated over the entire length of each UCE, and matches with low overall identity typically consist of short matches with high identity rather than long matches with poor identity (Methods).
